memory by 10%

Meanwhile **Chinese exports** soared by 32% in April compared with the same month last year. The economic recovery in America, combined with factory closures in other parts of the world, spurred demands for goods made in China. Chinese imports also jumped, rising 43% compared with April 2020, the fastest growth since January 2011.

---

A federal grand jury indicted four former Minneapolis police officers on charges of violating the civil rights of **George Floyd**, a black man whose killing set off a summer of massive racial-justice protests last year. **Derek Chauvin**—who was recently convicted of second- and third-degree murder and manslaughter after kneeling on Mr Floyd's neck for more than nine minutes—was among those indicted.

---

**Copper prices** hit a record high. **The commodity**, seen as a bellwether for the health of the global economy, rose by 1.4% to \$10,361 a tonne, surpassing the previous peak set in 2011, during a commodities boom. Demand comes from China and the green transition in rich countries: the metal is needed for electric vehicles, wind turbines and solar panels.

---

**Fact of the day:** Over 50 monetary authorities, representing the bulk of global GDP, are exploring digital currencies. [Read the full story.](#)

---

**Corrections:** We reported that IBM's new chip was projected to achieve 45% higher performance while using 75% less energy. That should have been 45% percent higher performance or 75% less energy, but not both at the same time. In another item, we referred to the Welsh Assembly; since last year it has been the Welsh Parliament. Apologies.

| $r^2$   | 0.752                          | 0.705                         | 0.774                          | 0.571                          |
| $n$   | 412                            | 412                           | 412                            | 412                            |

One extra year of life expectancy is worth as much as 4.3% annual growth in GDP per capita

One fewer year of internal conflict is worth as much as 30% annual growth in GDP per capita

# Predicting poverty and wealth from mobile phone metadata

Blumenstock J, Cadamuro G, On R 2015 // *Science*

# Word embeddings quantify 100 years of gender and ethnic stereotypes

Garg N, Schiebinger L, Jurafsky D, Zou J 2018 // *PNAS*

For some reason it is okay to have  $R = 0.5-0.7$   
for validating that  $X \sim Y$   
e.g. sentiment  $\sim$  well-being

This is probably wrong

Conceptually: being a man = being a prisoner

This is probably wrong

Conceptually: being a man = being a prisoner

Practically: correlation is not transitive

# The effects of errors of measurement on correlation coefficients

Thouless RH. 1939 // *British Journal of Psychology*

Saccenti E, Hendriks MH, Smilde AK 2020 // *Scientific reports*

# The proof and measurement of association between two things

Spearman C 1904 // *The American Journal of Psychology*

# Known but ignored

if error structure is simple it is not problematic

complex error structure is not convincing

Real-world case

# Real-world case

Depression level at schools  
Depression  $\sim$  academic performance

Let's use sentiment of post on VK  
Validation: PHQ-8

$R = 0.54$

Let's apply the model

Students in higher performing schools are  
less depressed

$R = -0.15, P = 0.0005$

Let's build a model to predict depression  
Instead of sentiment

$R = 0.54$

$R = 0.60$

$R = 0.56$

Let's apply the model again to confirm our findings regarding academic performance

$R = -0.15, P = 0.0005$

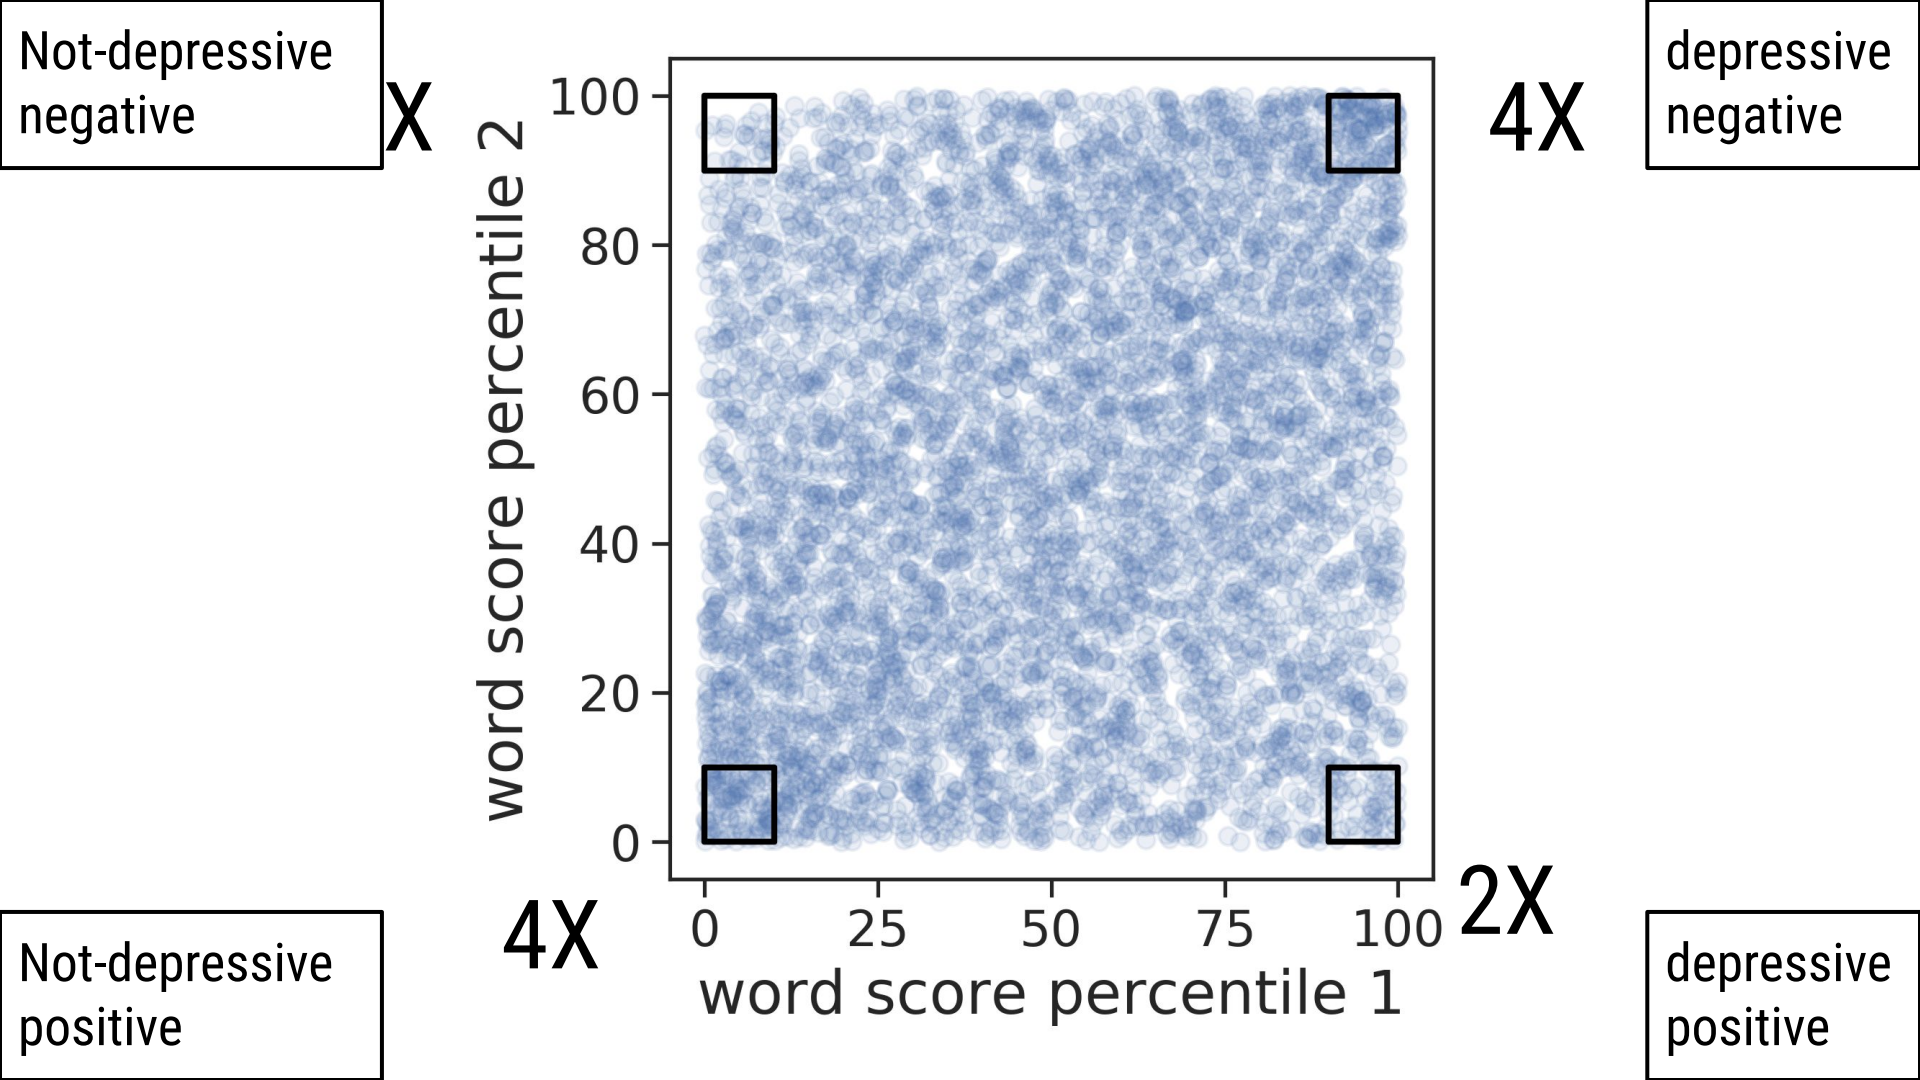

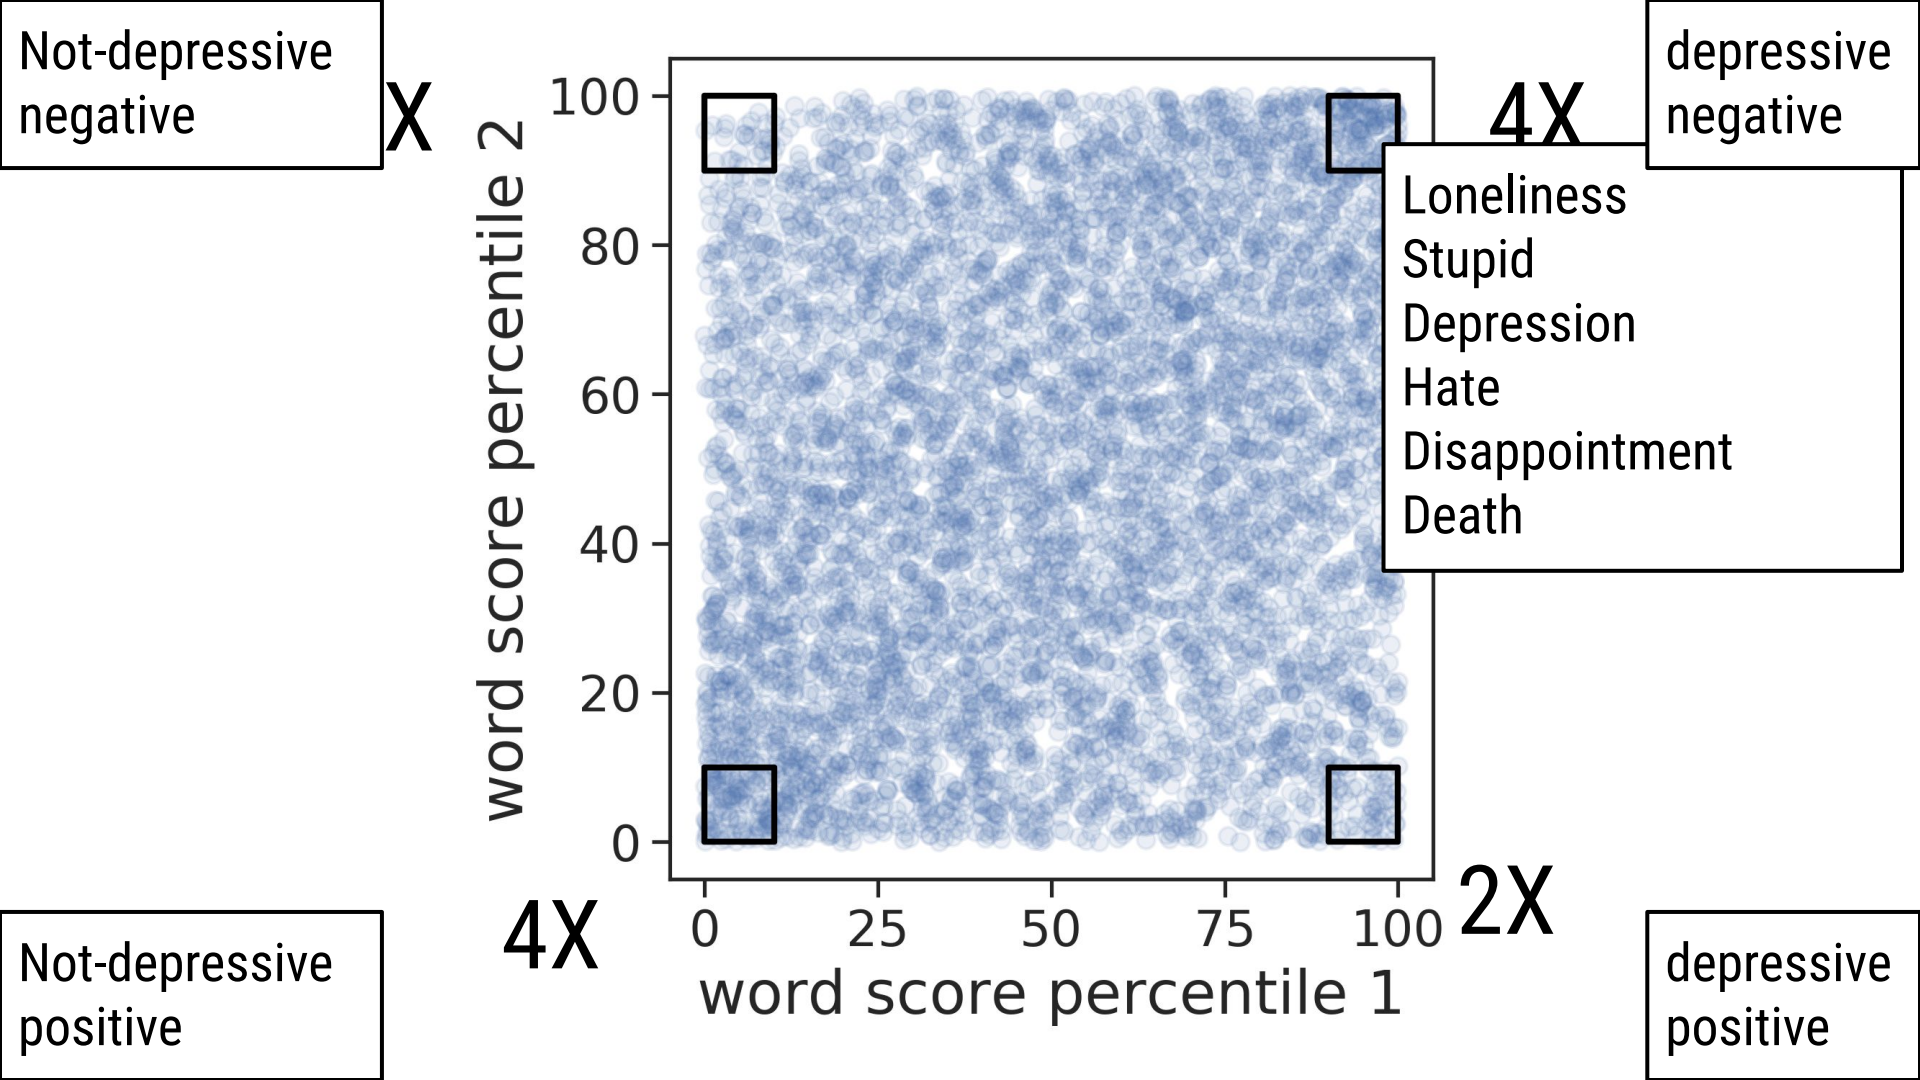

$R = 0.25, P < 10^{-8}$

Proxies are substantially different

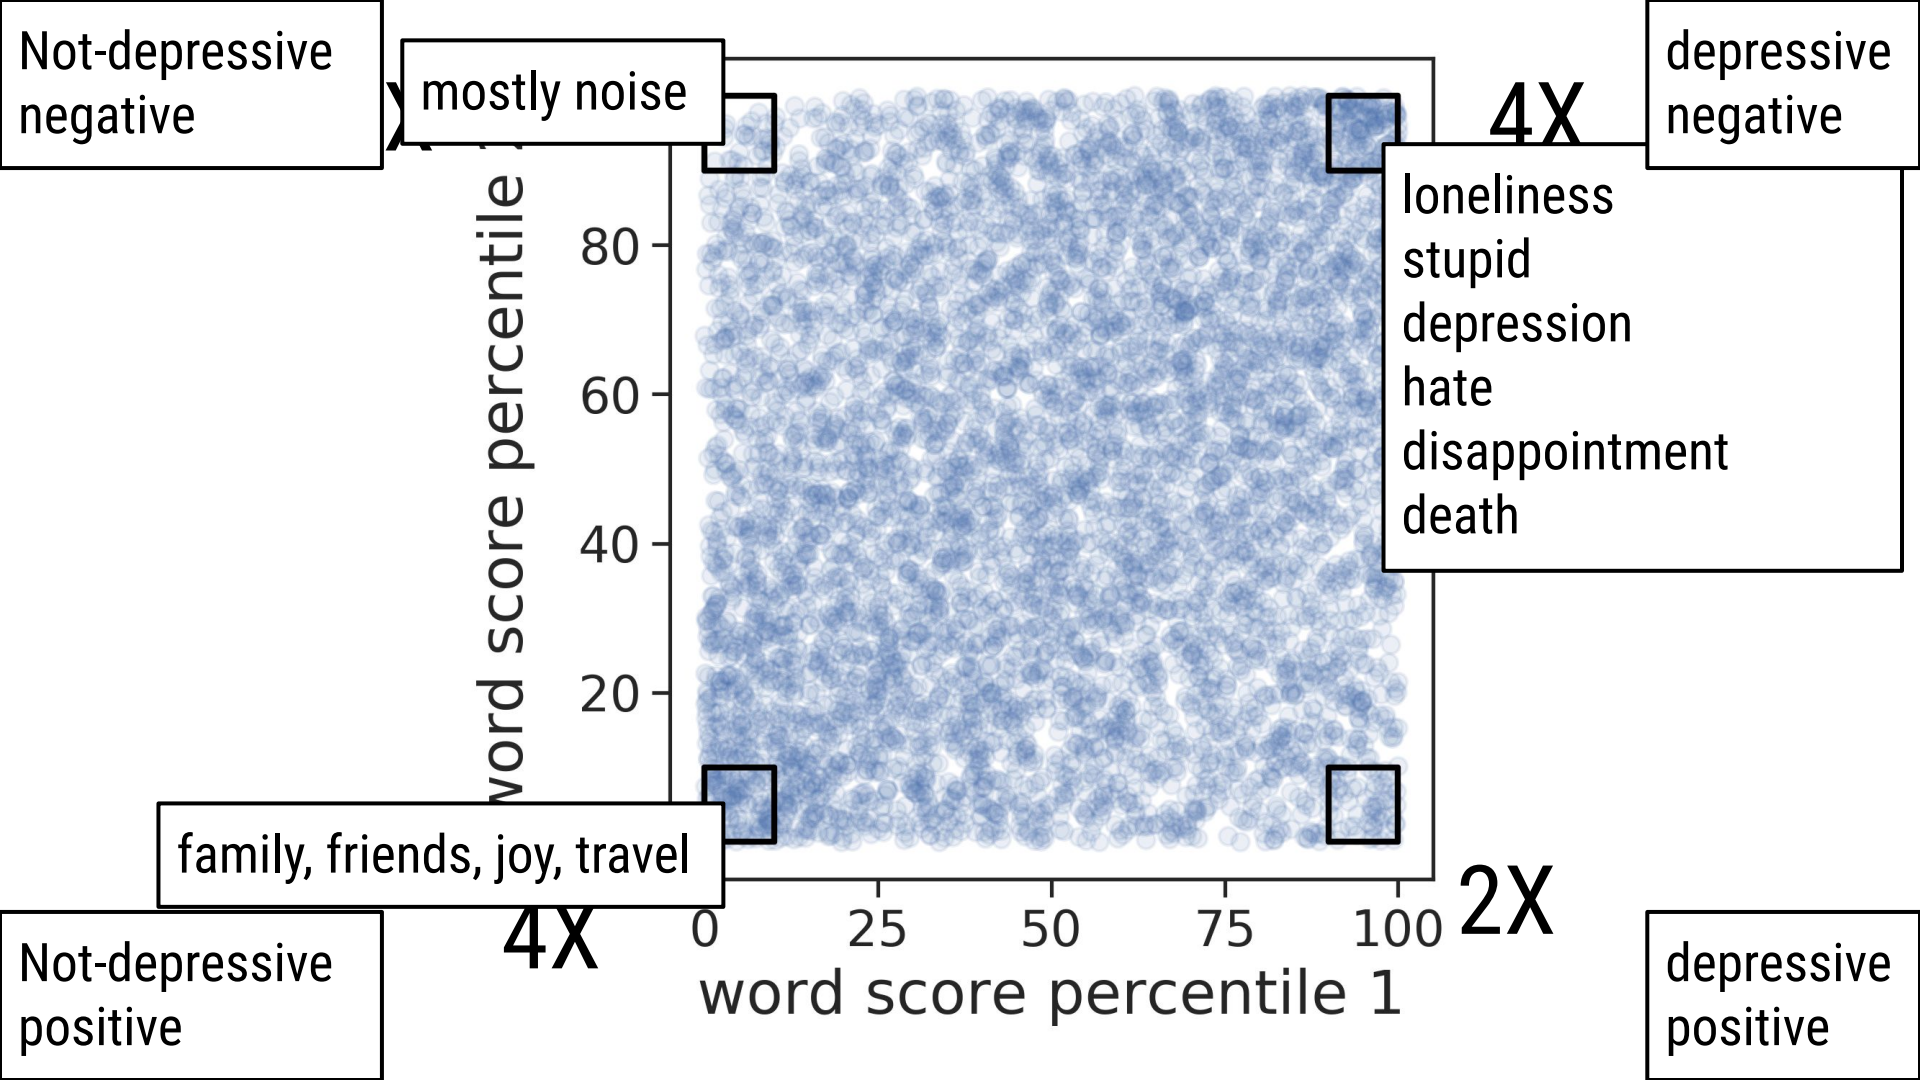

**Proxies are substantially different**  
Let's explore by computing word scores

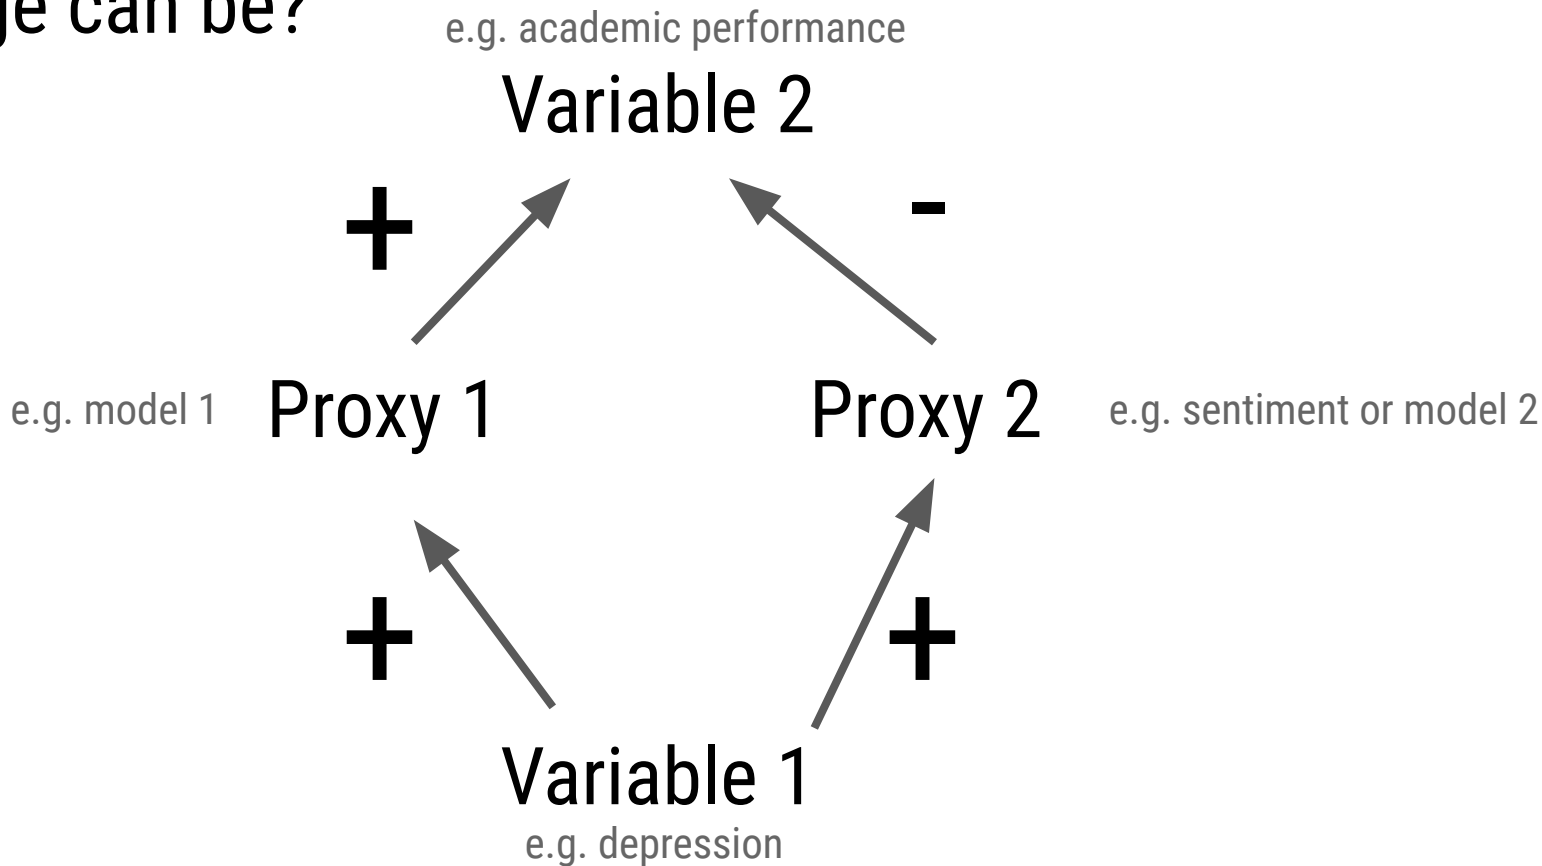

# How large can be?

# How large can be?

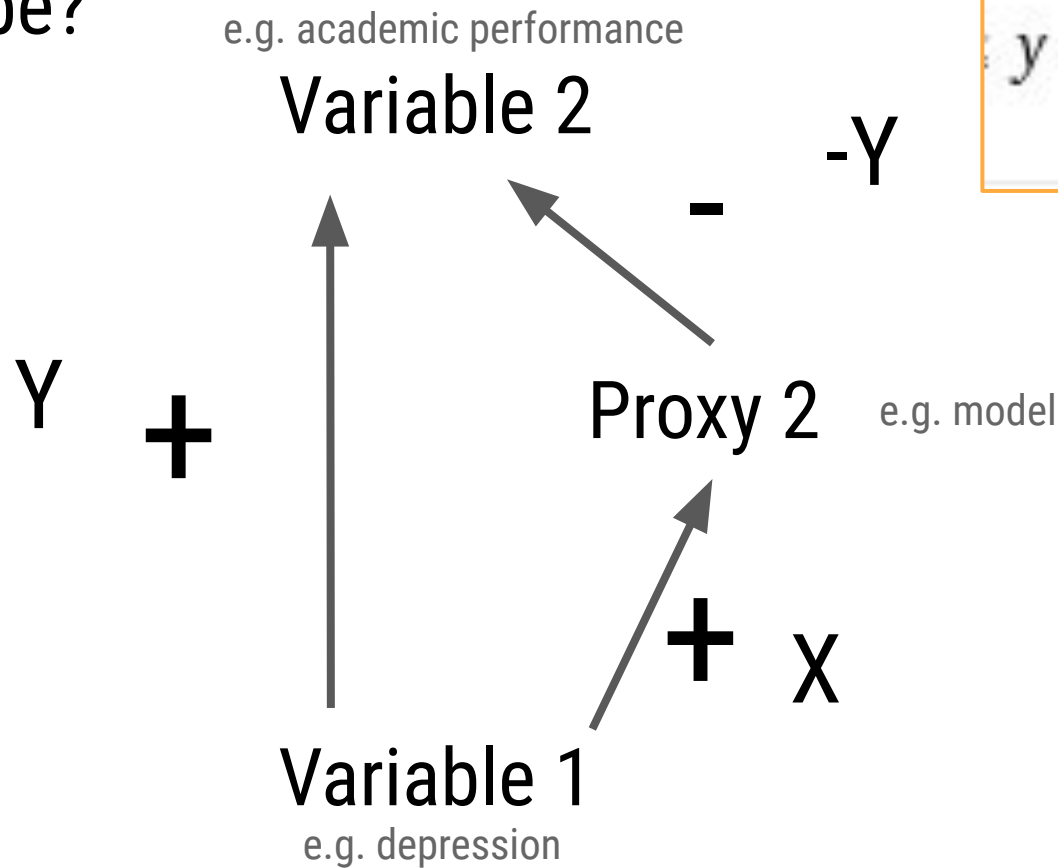

# How large can be?

$$1 + 2\rho\sigma\tau - (\rho^2 + \sigma^2 + \tau^2) \geq 0$$

How large can be?

$$y \leq \frac{\sqrt{1-x}}{\sqrt{2}}$$

$$1 + 2\rho\sigma\tau - (\rho^2 + \sigma^2 + \tau^2) \geq 0$$

If proxy is 0.5 one can have -0.50; 0.50 effects

If proxy is 0.5 one can have -0.50; 0.50 effects

If proxy is 0.8 one can have -0.31; 0.31 effects

If proxy is 0.5 one can have -0.50; 0.50 effects

If proxy is 0.8 one can have -0.31; 0.31 effects

If proxy is 0.9 one can have -0.22; 0.22 effects
